-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 25 June 2004.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 1 - 74, 76 - 82, and 84 - 153 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1 - 74, 76 - 82, and 84 - 153 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
  - ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## DETAILED ACTION

### *Claim Rejections - 35 USC § 103*

1. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.
2. Claims 1, 5, 10, 11, 29, and 36 are rejected under 35 U.S.C. 103(a) as being unpatentable over Okada et al., USPN 5,673,061, in view of Matsueda et al. USPN 6,380,917 B2.

### **Claim 1**

Okada teaches a display device with an active matrix circuit comprising a plurality of pixel TFTs over a substrate. Okada, col. 1, lines 21 – 34; col. 9, lines 34 – 35, 57 – 58; and figure 1. A source driver [data driver 102] and a gate driver [scanning driver 103] drive the active matrix circuit. Okada, col. 9, lines 51 – 60; and figure 1.

Okada teaches that  $n$  bit information out of  $m$  bit digital video data inputted from an external is used for a voltage gray scale method,  $V_0, V_8, V_{16}, V_{24}, V_{32}, V_{40}, V_{48}, V_{56}$ , and  $V_{64}$ ;  $(m-n)$  bit information is used for a time ratio gray scale method,  $t_0 - t_7$ . Okada, col. 11, lines 33 – 37; col. 12, lines 14 - 16; and figure 6. In the example given,  $m$  equals 12,  $n$  equals 8. Thus, both  $m$  and the  $n$  are integers equal to or larger than 2. It is inherent that  $m > n$  if  $(m-n)$  bit information is used for a time ratio gray scale method.

Okada does not teach an D/A converter.

Matsueda teaches a driving circuit and method for an electro-optical device such as a liquid crystal display. The device includes a D/A converter. Matsueda, col. 1, lines 10 – 19. Matsueda teaches that the D/A converter inputs and outputs a high voltage [maximum applied

Art Unit: 2675

voltage] and low voltage [minimum applied voltage]. Matsueda, col. 4, lines 25 – 45; col. 18, line 28 – col. 19, line 3; and figures 4 & 5. Matsueda also teaches an gray scale of  $2^N$  steps where N is a natural number. Matsueda, col. 2, line 66 – col. 3, line 30. It is inherent that each step of such gray scale would be  $(V_H - V_L) / 2^N$  where  $V_H$  is the high voltage and  $V_L$  is the low voltage input into the D/A converter.

It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the D/A converter as taught by Matsueda with the display device as taught by Okada to produce a driving circuit that is compatible with digital signal images and has a relatively simple and small-scale circuit. Matsueda, col. 2, lines 58 – 65; col. 26, line 39 – col. 27, line 3.

### Claim 5

Okada does not specifically teach an image gray scale of  $(2^m - (2^{m-n} - 1))$  patterns.

Okada teaches that patterns that between the specified pair of gray-scale voltages,  $(2^y - 1)$  intermediate voltages can be obtained. Therefore, the number of obtainable intermediate voltage is  $2^x (2^y - 1)$ , where x plus y equals the number of bits, with x the number of upper bits and y the number of lower bits. Okada, col. 15, line 51 – col. 16, line 33; col. 24, line 50 – 65.

It would have been obvious to one of ordinary skill in the art at the time of the invention to use the formula of Okada to obtain the same results as obtained by the formula  $(2^m - (2^{m-n} - 1))$ . But definition, x equals  $m - n$ ; y equals n. Thus, for  $m = 6$  and  $n = 3$ , according to the claim 5 the image gray scale has 57 patterns. According to Okada, the number of intermediate voltages is 56. However, the Okada formula excludes the zero or black value of 000000. If the black value is added to Okada, the image gray scale has 56 plus 1 for 57 patterns. For  $m = 5$  and  $n = 2$ ,

Art Unit: 2675

according to claim 5 the image gray scale has 25 patterns. According to Okada, the number of intermediate voltages is 24 plus the black value of 1 for 25 patterns.

The claim 5 formula can be derived from the Okada formula as follows.

According to Okada, the number of obtainable intermediate voltages is  $2^x (2^y - 1)$ .

Thus, the number of image gray scale patterns with the black value is  $2^x (2^y - 1) + 1$ .

Since  $x = m - n$  and  $y = n$ , then

$$2^x (2^y - 1) + 1 = 2^{m-n} (2^n - 1) + 1 = 2^{m-n+n} - 2^{m-n} + 1 = 2^m - 2^{m-n} + 1 = 2^{m-(2^{m-n}-1)}$$

Therefore, the claim 5 formula is identical to the Okada formula.

### Claims 10 and 29

Okada does not specifically teach that  $m$  is 8 and  $n$  is 2.

It would have been obvious to one of ordinary skill in the art at the time of the invention to create the display device of Okada where  $m$  is 8 and  $n$  is 2. Okada invites such teaching,

In the driving circuit in Example 1 described above, a pair of gray-scale voltages are specified from the plurality of gray-scale voltages, based on the upper three bits  $D_5$ ,  $D_4$ , and  $D_3$  of the 6-bit video data  $D_0$ ,  $D_1$ ,  $D_2$ ,  $D_3$ ,  $D_4$ , and  $D_5$ . A pair of analog switches corresponding to the specified pair of gray-scale voltages are driven at a duty ratio corresponding to the lower three bits  $D_2$ ,  $D_1$ , and  $D_0$ . However, the invention is not limited to this manner.

Okada, col. 15, lines 43 – 50.

In this example, the number of the oscillating signals  $t_0 - t_4$  has been assumed to be equal to the number of lower bits (i.e., 5) used for specifying the oscillating signal  $T$  of the 8-bit video data. However, the invention is not limited to this specific case. For example, some of the oscillating signals  $t_0 - t_4$  can be omitted, because the omitted oscillating signal(s) can be generated by repeatedly using the remaining oscillating signals. Also, the duty ratio of the oscillating signal is not limited to the above-described example.

Okada, col. 21, lines 33 – 41.

### Claims 11 and 36

Okada teaches, in an example, that  $m$  is 12 and  $n$  is 4. Okada, col. 2, line 37 – col. 3, line 20; and figures 22 and 23.

3. Claims 2, 6, 26, 30, 33, and 37 are rejected under 35 U.S.C. 103(a) as being unpatentable over Okada et al. in view of Matsueda et al. as applied to claim 1 above, and further in view of Yasunishi, USPN 6,094,243.

### Claim 2

Claim 2 describes a display device similar to claim 1 but adds that one frame image comprises  $2^{m-n}$  subframes. Although Okada does not specifically state this formula, it uses the formula to determine the number of required gray-scale voltages. Okada, col. 2, lines 15 – 22.

Neither Matsueda nor Okada specifically describe  $k$  subframes having  $2^k$  levels.

Yasunishi teaches dividing a period  $T$  into  $k$  subframes with  $2^k$  levels. Yasunishi, col. 8, lines 44 – 67.

It would have been obvious to one of ordinary skill in the art at the time of the invention to combine  $k$  subframes with  $2^k$  levels with the display device of Okada to produce a display device that has each frame image comprising  $2^{m-n}$  subframes. Yasunishi invites such combination by teaching,

There are provided subframes of a number greater than the bit length of data (i.e., the number of gray-scale bits) which represent the gray-scale levels of input image data. A period and a voltage value are set independently for each subframe, whereby a certain number of gray-scale levels can be effected with a lesser number of subframes as compared to the conventional frame modulation method. Moreover, by setting the period and the voltage value independently for each subframe, it is possible to avoid the reduction in the minimum pulse width

which would occur in the conventional pulse width modulation method as the number of gray-scale levels increases. As a result, flickers in the displayed images and the display non-uniformity caused by the waveform distortion can be suppressed.

Furthermore, image data for one frame is processed as binary display data which is set independently for each subframe. Therefore, it is possible to eliminate the complicated large-scale arithmetic circuit for performing square-sum calculation and square-root extraction, and a high-precision liquid crystal driver for outputting the analog voltage amplitude, which are required in the conventional amplitude modulation method.

Furthermore, by setting a voltage amplitude independently for each subframe, it is possible to construct a display device most suitable for the response performance of the liquid crystal panel and the voltage endurance of the liquid crystal driver.

Thus, the invention described herein makes possible the advantages of: (1) providing a liquid crystal display device capable of conducting a gray-scale display while suppressing flickers in the displayed images which would occur in the frame modulation method and suppressing the display non-uniformity which would occur in the pulse width modulation method, without increasing the circuit scale so significantly as in the amplitude modulation method; and (2) providing a method for driving such a liquid crystal display device.

Yasunishi, col. 6, line 52 – col. 7, line 21.

#### **Claim 6**

Claim 6 describes a display device similar to claim 2 but adds that an image is displayed by an image gray scale of  $(2^m - (2^{m-n} - 1))$  patterns. As discussed in the response to claim 5 above, the Okada formula is the same as the  $(2^m - (2^{m-n} - 1))$  pattern.

#### **Claims 26 and 30**

Okada does not specifically teach that  $m$  is 8 and  $n$  is 2. For the reasons stated in the rejections of claims 10 and 29 above, it would have been obvious to one of ordinary skill in the art at the time of the invention to create the display device of Okada where  $m$  is 8 and  $n$  is 2.

**Claims 33 and 37**

Okada teaches, in an example, that  $m$  is 12 and  $n$  is 4. Okada, col. 2, line 37 – col. 3, line 20; and figures 22 and 23.

4. Claims 3, 4, 8, 27, 28, 32, 34, 35, and 39 are rejected under 35 U.S.C. 103(a) as being unpatentable over Okada et al., Matsueda et al., and Yasunishi, as applied to claim 2 above, and further in view of Yamazaki et al., USPN 6,335,716 B1.

**Claims 3 and 4**

Claims 3 and 4 describes a display device similar to claim 2 but adds that the active matrix circuit, the drivers, and the converter circuit are formed over a substrate.

Okada specifically teaches that active matrix circuits and drivers are formed over a substrate. Although it is obvious, perhaps inherent, that the converter circuit of Okada would be formed over the same substrate, Okada does not specifically state such.

Yamazaki et al. teaches that all circuits for a display device formed over the same substrate. Yamazaki, col. 3, lines 38 – 50.

It would have been obvious to one of ordinary skill in the art at the time of the invention to form all circuits on the same substrate as taught by Yamazaki-including all the circuits taught by Okada et al., Matsueda, and Yasunishi because it is easier and cheaper to manufacture and the display would require less space.

**Claim 8**

Claim 8 describes a display device similar to claim 2 but adds that an image is displayed by an image gray scale of  $(2^m - (2^{m-n-1}))$  patterns. As discussed in the response to claim 5 above, the Okada formula is the same as the  $(2^m - (2^{m-n-1}))$  pattern.

**Claims 27, 28 and 32**

Okada does not specifically teach that m is 8 and n is 2. For the reasons stated in the rejections of claims 10 and 29 above, it would have been obvious to one of ordinary skill in the art at the time of the invention to create the display device of Okada where m is 8 and n is 2.

**Claims 34, 35, and 39**

Okada teaches, in an example, that m is 12 and n is 4. Okada, col. 2, line 37 – col. 3, line 20; and figures 22 and 23.

5. Claims 7, 31, and 38 are rejected under 35 U.S.C. 103(a) as being unpatentable over Okada et al. in view of Matsueda et al. as applied to claim 1 above, and further in view of Yamazaki et al.

**Claim 7**

Claim 7 describes a display device similar to claim 2 but adds that all circuits are formed on the same substrate and that an image is displayed by an image gray scale of  $(2^m - (2^{m-n-1}))$  patterns. As discussed in the response to claim 5 above, the Okada formula is the same as the  $(2^m - (2^{m-n-1}))$  pattern.

It would have been obvious to one of ordinary skill in the art at the time of the invention to form all circuits on the same substrate as taught by Yamazaki including all the circuits taught

Art Unit: 2675

by Okada et al. and Matsueda because it is easier and cheaper to manufacture and the display would require less space.

### **Claim 31**

Okada does not specifically teach that  $m$  is 8 and  $n$  is 2. For the reasons stated in the rejections of claims 10 and 29 above, it would have been obvious to one of ordinary skill in the art at the time of the invention to create the display device of Okada where  $m$  is 8 and  $n$  is 2.

### **Claims 38**

Okada teaches, in an example, that  $m$  is 12 and  $n$  is 4. Okada, col. 2, line 37 – col. 3, line 20; and figures 22 and 23.

6. Claims 12 – 17, 40 – 74, 76 – 82, and 89 – 152 are rejected under 35 U.S.C. 103(a) as being unpatentable over Yamazaki et al., or Holmes et al., USPN 3,792,919, or Kimura, USPN 5,610,741, or Munyan, USPN 5,761,485, or Stambolic et al., USPN 5,893,798, or Kleinschmidt et al., USPN 6,085,112, or Sato, USPN 6,167,208, or Yun et al., USPN 5,835,139, in view of Okada et al. and Matsueda et al. as applied to claim 1 or 5 above, or of Okada et al., Matsueda et al., and Yasunishi as applied to claim 2 or 6 above, or of Okada et al., Matsueda et al., Yasunishi, and Yamazaki as applied to claim 3, 4 or claim 8 above, or of Okada et al., Matsueda, and Yamazaki as applied to claim 7 above.

### **Claims 12 – 17, 40 – 74, 76 – 82, and 89 – 152**

As to claims 12, 40 – 46, Yamazaki teaches a rear projector comprising three display devices Yamazaki, col. 16, lines 1 – 25; and figure 11. As to claims 13, 47 – 53, Yamazaki teaches a front projector comprising three display devices. Yamazaki, col. 15, lines 32 – 56; and

Art Unit: 2675

figure 10. As to claims 14, 54 - 60, Holmes teaches a single plate type rear projector. Holmes, col. 8, lines 48 - 58. As to claims 15, 61 - 67, Yamazaki teaches a goggle type display comprising two display devices. Yamazaki, col. 26, lines 38 - 40; and figure 22D. As to claims 16, 68 - 74, Kimura teaches a display for portable information terminal. Kimura, col. 1, lines 11 - 16. As to claims 17, 76 - 82, Yun et al., teaches a notebook type personal computer. Yun, col. 1, lines 49 - 52; and figure 9. As to claims 89 - 96, Yamazaki teaches a mobile telephone. Yamazaki, col. 26, lines 26 - 29. As to claims 97 - 104, Yamazaki teaches a video camera. Yamazaki, col. 26, lines 29 - 33; and figure 22B. As to claims 105 - 112, Yamazaki teaches a mobile computer. Yamazaki, col. 26, lines 34 - 37; and figure 22C. As to claims 113 - 120, Munyan teaches a portable electric book. Munyan, col. 1, lines 56 - 57. As to claims 121 - 128, Kimura teaches a personal computer. Kimura, col. 1, lines 11 - 16. As to claims 129 - 136, Stambolic et al. teaches a electronic game device. Stambolic, col. 1, lines 9 - 10. As to claims 137 - 144, Kleinschmidt teaches an image reproduction device. Kleinschmidt, col. 5, lines 58 - 61. As to claims 145 - 152, Sato teaches a digital camera. Sato, col. 1, lines 7 - 10.

None of these patents specifically teach the display device of Okada.

It would have been obvious to one of ordinary skill in the art at the time of the invention to use the display device of Okada for these generally small appliances. Okada teaches,

Accordingly, it is unnecessary to provide an additional driving circuit depending on the cases where the driving circuit directly outputs one of the plurality of gray-scale voltages and where the driving circuit alternately outputs the specified pair of gray-scale voltages. As a result, it is possible to simplify the configuration of the driving circuit, and the size of the driving circuit can be minimized.

Thus, the invention described herein makes possible the advantage of providing a driving circuit for a display apparatus, which has a simplified and

Art Unit: 2675

small construction, and which can display an image with multiple gray scales in accordance with multi-bit video data.

Okada, col. 7, line 59 – col. 8, line 3.

7. Claims 9 and 19 - 25 are rejected under 35 U.S.C. 103(a) as being unpatentable over Okada et al. and Matsueda et al. as applied to claim 1 or 5 above, or of Okada et al., Matsueda et al., and Yasunishi as applied to claim 2 or 6 above, or of Okada et al., Matsueda et al., Yasunishi, and Yamazaki as applied to claim 3, 4 or claim 8 above, or of Okada et al., Matsueda et al., and Yamazaki as applied to claim 7 above, and further in view of Wu et al., USPN 6,245,256 B1.

#### **Claims 9 and 19 - 25**

Okada does not teach thresholdless antiferroelectric mixed liquid crystal.

Wu teaches thresholdless antiferroelectric mixed liquid crystal indicating electro-optical characteristic of V-shape. Wu, col. 3, lines 2 –25; and figure 12.

It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the antiferroelectric mixed liquid crystal of Wu with the display device of Okada.

Wu teaches,

According to Inui's report, when the mixing ratio of I:II:III=40:40:20, no  $E_{th}$  value is found, and its field-induced antiferroelectric to ferroelectric switching shows a V-shaped switching (see FIG. 12). Inui give the name of "Thresholdless antiferroelectric liquid crystals; TLAFLCs" to this antiferroelectric liquid crystal mixture. These thresholdless antiferroelectric liquid crystals have the following properties:

- (1) Great tilt angle ( $>35^{\circ}$ );
- (2) Low driving voltage ( $<2V/\mu m^{-1}$ );
- (3) Ideal gray scale;

Art Unit: 2675

- (4) Fast antiferroelectric to ferroelectric switching time ( $<50 \mu\text{s}$ );
- (5) High contrast value ( $>100$ ); and
- (6) Broad viewing angle ( $>60^\circ$ ).

The aforesaid properties eliminate the gray scale problem occurred during the fabrication of a passive matrix addressing (PM) surface stable ferroelectric liquid crystal display, and also improve the drawback of being difficult to obtain a high contrast ratio commonly existed in regular active matrix (AM) or thin film transistor (TFT) addressing type deformed-helix ferroelectric liquid crystal displays and passive matrix addressing type antiferroelectric liquid crystal displays.

Wu, col. 3, lines 2 –25.

8. Claims 18, 84 – 88, and 153 are rejected under 35 U.S.C. 103(a) as being unpatentable Okada et al. and Matsueda et al. as applied to claim 1 or 5 above, or of Okada et al., Matsueda et al., and Yasunishi as applied to claim 2 or 6 above, or of Okada et al., Matsueda et al., Yasunishi, and Yamazaki as applied to claim 3, 4 or claim 8 above, or of Okada et al., Matsueda et al., and Yamazaki as applied to claim 7 above, and further in view of Bhargava, USPN 5,455,489.

**Claims 18, 83 – 88, and 153**

Okada does not teach an EL display.

Bhargava teaches an EL display. Bhargava, col. 9, lines 46 – 64.

It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the EL display of Bhargava with the display device of Okada. Bhargava teaches,

Today, EL displays offer unique properties such as flat-slim and high contrast but suffer from (1) poor efficiency, (2) limited color availability and control, (3) lack of gray scale, and (4) expensive drives for high voltage operation.

As will be clear from the foregoing exposition, an EL display whose phosphor layer comprises a DNC particle layer will exhibit higher efficiency,

Art Unit: 2675

improved gray scale, and due again to its tiny sized particles will operate at low voltages.

Bhargava, col. 9, line 60 – col. 10, line 2. This is especially true in light of Okada's invitation.

Thus, the invention described herein makes possible the advantage of providing a driving circuit for a display apparatus, which has a simplified and small construction, and which can display an image with multiple gray scales in accordance with multi-bit video data.

Okada, col. 7, line 66 – col. 8, line 3.

### ***Response to Arguments***

9. Applicant's arguments with respect to claims 1 – 74 and 76 – 153 have been considered but are moot in view of the new ground(s) of rejection.

### ***Conclusion***

10. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event,

Art Unit: 2675

however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

11. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Leland R. Jorgensen whose telephone number is 703-305-2650. The examiner can normally be reached on Monday through Friday, 7:00 a.m. through 3:30 p.m..

The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
